

Question 1 of 4

Let A be the N by N matrix given by

$$\begin{bmatrix} 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & \dots & 0 & 0 \\ 0 & 2 & 2 & 0 & 0 & 0 & 0 & 0 & \dots & 0 & 0 \end{bmatrix}$$

$$\begin{matrix} \dots \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \dots & N-1 & N-1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \dots & 0 & N \end{matrix}$$

That is, the matrix with entries 1 through N on the diagonal and entries 1 through $N-1$ on the superdiagonal. Let $B=A^2$ and let $N=1001$.

What is the difference between the two largest eigenvalues of B ?

Question 2 of 4

Alex, Bob and Chloe are playing a game where each of them chooses a real number between 0 and 1 and whoever ended up choosing the middle number is the winner. Suppose Bob has reason to believe Alex will randomly choose a number between 0 and 1, and Chloe will choose a random number between .5 and .75.

What number should Bob choose to optimize his chances of winning, to four decimal places?

Question 3 of 4

You have a receiver that can receive two signals, signal A and signal B. Both signals have 0 mean and typically arrive with equal frequency. Signal A is normally distributed with variance 4. Signal B is normally distributed with variance 9.

You observe a signal with magnitude 2.

What is the probability the signal you observe is signal A, to two decimal places?

Question 4 of 4

$147!$ ($147 \cdot 146 \cdot 145 \cdot 144 \cdot \dots \cdot 3 \cdot 2 \cdot 1$) has 247 digits. Interestingly, the final N digits of this number repeat.

Find N .
